1. Directory Structure & File Index

The SentiFlow application is built using standard, static web technologies (HTML5, CSS3, ES6 JavaScript) requiring no pre-compilation, package installers, or environment configurations. Below is the file index:

- * **index.html:** Core markup layout defining the multi-tab responsive interface and loading external Chart.js via CDN.
- * **styles.css:** Comprehensive custom CSS stylesheet defining visual custom variables, glassmorphism themes, and animations.
- * **nlp.js:** Linguistic parsing logic containing tokenize(), analyzeSentence(), and the main SentimentAnalyzer class.
- * **lexicon.js:** Static data dictionary file containing over 2,000 baseline valence scores for words and emojis.
- * **mockData.js:** Mock social and commercial comments sorted across four industries to feed simulated streams.
- * **app.js:** Main application driver connecting user events, updating radial SVG rings, managing file parses, and rendering Chart.js.

2. Installation & Running Locally

Because SentiFlow consists entirely of static client-side files, running the application locally is instantaneous:

- * **Method A:** Open File Explorer, go to the folder 'C:\Users\HP\Desktop\navodita infotech pro 1', and double-click 'index.html'. It will open directly in your web browser.
- * **Method B:** Open any web browser (Chrome, Edge, or Firefox) and drag the 'index.html' file from your desktop folder directly into the browser window.
- * **Method C:** Open VS Code inside the project directory, install the extension 'Live Server', right-click 'index.html' and select 'Open with Live Server' to host it on local port 5500.

3. Deploying Live to GitHub Pages

SentiFlow is optimized for zero-cost public hosting via GitHub Pages. Follow these steps to host your repository live:

- * **Step 1:** Create an empty repository on GitHub named 'sentiflow'. Do not initialize it with a README or license.
- * **Step 2:** In your command prompt, link your local repository and push the committed files to GitHub using the commands:

```
cd "C:\Users\HP\Desktop\navodita infotech pro 1"
git remote add origin https://github.com/Raunak0006/sentiflow.git
git branch -M main
git push -u origin main
```

- * **Step 3:** Go to your repository settings on GitHub, select 'Pages' from the sidebar, set the build source to 'main'

branch, and click 'Save'.

* **Step 4:** Within 30 seconds, your site will be live at: <https://Raunak0006.github.io/sentiflow/>

4. Operating Instructions & User Manual

The SentiFlow dashboard is divided into four easy-to-use panels:

4.1 Using the Sandbox

Type or paste any customer review into the text area. The word count, character count, and overall sentiment classification will update instantly. You can click on the colored sentence badges to open the Linguistic Inspector, which shows the base valence score and any grammar overrides (e.g., negations or boosters) for each word.

4.2 Using the Intelligence Stream

Navigate to the 'Intelligence Stream' tab, select an industry sector (e.g., Gourmet Food Delivery) from the dropdown, and watch reviews tick in. You can pause or resume the stream at any time. The line chart displays the historical rolling average compound score of the stream.

4.3 Using the Bulk Document Processor

Navigate to the 'Bulk Document Processor' tab, drag and drop any CSV or JSON file containing review columns, select the column representing the review text in the dropdown, and click 'Run Sentiment Sweep'. The app will instantly display a pie chart of the sentiment distribution, a bar chart of the top descriptors, and a paginated table of the parsed rows. Click 'Export CSV' to download the processed data with sentiment scores appended.

4.4 Using the Lexicon Tuning Studio

Navigate to the 'Lexicon Tuning Studio' tab to customize SentiFlow's dictionary. You can toggle negations, intensifiers, or contrastive conjunction rules, search for any of the 2,000+ words, adjust their sentiment weights using the interactive slider, and save overrides. Click 'Restore Defaults' to reset all custom edits.

5. Codebase Maintenance & Troubleshooting

To modify the default lexicon, open 'lexicon.js' and add or edit key-value pairs (e.g., 'awesome': 3.5). To customize grammatical rules, open 'nlp.js' and modify the booster or negation dictionaries.

*** Issue: Drag and drop not working:** Ensure your CSV has clear headers in the first row. Ensure you select the correct text column in the dropdown before clicking run.

*** Issue: Charts not rendering:** SentiFlow requires an active internet connection on the first load to pull Chart.js from the jsDelivr CDN. Ensure you are online.
